## The Coders' Club

Machine Learning: G1

Week 4: Assignment

Topic:

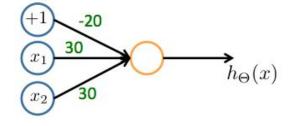

Neural Networks: Representation

## **Some Additional Courses:**

- Machine Learning Onramp (MathWorks)
   <a href="https://www.mathworks.com/learn/tutorials/machine-learning-onramp.">https://www.mathworks.com/learn/tutorials/machine-learning-onramp.</a>
   <a href="https://www.mathworks.com/learn/tutorials/machine-learning-onramp.">httml</a>
- Deep Learning Onramp (MathWorks)
   <a href="https://www.mathworks.com/learn/tutorials/deep-learning-onramp.htm">https://www.mathworks.com/learn/tutorials/deep-learning-onramp.htm</a>
- Al From the Data Center to the Edge An Optimized Path Using Intel® Architecture (Intel AI)
   <a href="https://software.intel.com/en-us/ai/courses/data-center-to-edge">https://software.intel.com/en-us/ai/courses/data-center-to-edge</a>
- Machine Learning (Intel)
   <a href="https://software.intel.com/en-us/ai/courses/machine-learning">https://software.intel.com/en-us/ai/courses/machine-learning</a>

## **Neural Networks: Representation**

- Q.1. Which of the following statements are true? Check all that apply.
  - The activation values of the hidden units in a neural network, with the sigmoid activation function applied at every layer, are always in the range (0, 1).
  - A two layer (one input layer, one output layer; no hidden layer) neural network can represent the XOR function.
  - Any logical function over binary-valued (0 or 1) inputs x<sub>1</sub> and x<sub>2</sub> can be (approximately) represented using some neural network.
  - Suppose you have a multi-class classification problem with three classes, trained with a 3-layer network. Let  $a_1^{(3)} = (h_{\Theta}(x))_1$  be the activation of the first output unit, and similarly  $a_2^{(3)} = (h_{\Theta}(x))_2$  and  $a_3^{(3)} = (h_{\Theta}(x))_3$ . Then for any input x, it must be the case that  $a_1^{(3)} + a_2^{(3)} + a_3^{(3)} = 1$ .
- Q.2. Consider the following neural network which takes two binary-valued inputs  $x_1, x_2 \in \{0, 1\}$  and outputs  $h_{\Theta}(x)$ . Which of the following logical functions does it (approximately) compute?

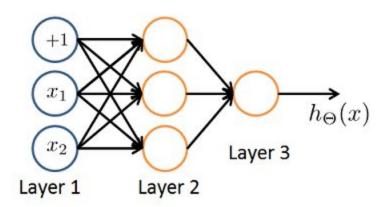

- OR
- AND
- NAND (meaning "NOT AND")
- XOR (exclusive OR)

Q.3. Consider the neural network given below. Which of the following equations correctly computes the activation  $a_1^{(3)}$ ? Note: g(z) is the sigmoid activation function.

- $a_1^{(3)} = g(\Theta_{1,0}^{(2)} a_0^{(2)} + \Theta_{1,1}^{(2)} a_1^{(2)} + \Theta_{1,2}^{(2)} a_2^{(2)})$
- $a_1^{(3)} = g(\Theta_{1,0}^{(1)} a_0^{(1)} + \Theta_{1,1}^{(1)} a_1^{(1)} + \Theta_{1,2}^{(1)} a_2^{(1)})$
- $a_1^{(3)} = g(\Theta_{1,0}^{(1)} a_0^{(2)} + \Theta_{1,1}^{(1)} a_1^{(2)} + \Theta_{1,2}^{(1)} a_2^{(2)})$
- The activation  $a_1^{(3)}$  is not present in this network.

## Q.4. You have the following neural network:

You'd like to compute the activations of the hidden layer  $a^{(2)} \in \mathbb{R}^3$ . One way to do so is the following Octave code.

```
% Theta1 is Theta with superscript "(1)" from lecture
% ie, the matrix of parameters for the mapping from layer 1 (input) to layer 2
% Theta1 has size 3x3
% Assume 'sigmoid' is a built-in function to compute 1 / (1 + exp(-z))

a2 = zeros (3, 1);
for i = 1:3
    for j = 1:3
        a2(i) = a2(i) + x(j) * Theta1(i, j);
end

a2(i) = sigmoid (a2(i));
end
```

You want to have a vectorized implementation of this (i.e. one that does not use for loops). Which of the following implementations correctly compute  $a^{(2)}$ ? Check all that apply.

```
a2 = sigmoid(Theta1 * x);
a2 = sigmoid(x * Theta1);
a2 = sigmoid(Theta2 * x);
z = sigmoid(x); a2 = (Theta1 * z)
```

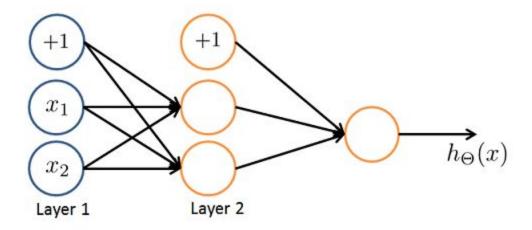

Q.5. You are using the neural network pictured below and have learned the parameters

$$\Theta^{(1)} = \begin{bmatrix} 1 & 1 & 2.4 \\ 1 & 1.7 & 3.2 \end{bmatrix}$$

(used to compute  $a^{(2)}$ ) and  $\Theta^{(2)} = [1 \quad 0.3 \quad -1.2]$  (used to compute  $a^{(3)}$ ) as a function of  $a^{(2)}$ ). Suppose you swap the parameters for first hidden layer between its two units so

$$\Theta^{(1)} = egin{bmatrix} 1 & 1.7 & 3.2 \\ 1 & 1 & 2.4 \end{bmatrix}$$

and also swap the output layer so  $\Theta^{(2)}$  = [1 -1.2 0.3]. How will this change the value of the output  $h_{\Theta}(x)$ ?

- It will stay the same.
- It will increase.
- It will decrease.
- Insufficient information to tell: it may increase or decrease
